### Introduction

Negation is a sublime style used by the Arabs, included in their studies and language sciences. It is a transformational writing where plea, guidance equity and other deep means are used in negation transformation. Negation is a structure includes many of the imbricate linguistic structures. Grammarians stated that negation is the imperative negation and this means that negation is linguistically formed through imperative structure which is a deep linguistic structure preceding the phases of structure formation in imperative. Imperative structure is a medium structure not evoked by linguistic mores.

This study is a transformation approximation documenting the relation between negation and imperative as transformational patterns for developed meanings in formation and reference.
